Abstract

We consider \mathbb{R} as well as $\dim_{\mathcal{S}}, \dim_{\mathcal{H}} \subseteq \dim_{\mathcal{W}}$.

Chapter 1

An Introduction to the Einstein Relation

In this introductory chapter, we wish to briefly expose the ingredients of the ER - the Hausdorff dimension $\dim_{\mathcal{H}}$, the spectral dimension $\dim_{\mathcal{S}}$, and the walk dimension $\dim_{\mathcal{W}}$ - and state some of their properties.

1.1 Hausdorff measure and Hausdorff dimension

Although the concepts of Hausdorff measure and dimension are well-known, we give the definitions in the interest of completeness. In what follows, let (E, d) be a metric space.

Definition 1.1 (Hausdorff outer measure). For fixed $s \geq 0$, any subset $S \subseteq E$ and any $\delta > 0$, let

$$\mathcal{H}^s_{\delta}(S) := \inf \left\{ \sum_{i \in I} (\operatorname{diam} U_i)^s : |I| \leq \aleph_0, S \subseteq \bigcup_{i \in I} U_i \subseteq E, \operatorname{diam} U_i \leq \delta \right\},\,$$

i.e. the infimum is taken over all countable coverings of S with diameter at most δ . The s-dimensional Hausdorff outer measure of S is now defined to be

$$\mathcal{H}^{s}(S) := \lim_{\delta \searrow 0} \mathcal{H}^{s}_{\delta}(S). \tag{1.1}$$

Observe that the limit in (1.1) exists or equals ∞ , since $\mathcal{H}^s_{\delta}(S)$ is monotonically nonincreasing in δ , yet bounded from below by 0. Furthermore, it can be shown that \mathcal{H}^s defines a metric outer measure on E, thus restricting to a measure on a σ -algebra containing the Borel σ -algera $\mathcal{B}(E)$ (cf. [Mat99, p.54ff]). By definition, the obtained measure then is the s-dimensional Hausdorff measure which we will denote by \mathcal{H}^s as well.

In the special case of (E, d) being an Euclidean space, Hausdorff measures interpolate between the usual Lebesgue measures λ^n : For s = 0, we have simply $\mathcal{H}^0(S) = \#S$, whereas for any integer n > 0, it can be shown that there exists a constant $c_n > 0$ depending only on n such that $\mathcal{H}^n = c_n \lambda^n$, where the constant evaluates to the volume of the unit ball.

Since exponential functions are monotonically increasing, the Hausdorff measures' dependence on s exhibits the same behaviour for a fixed set S. At the same time, simple estimates yield that if $\mathcal{H}^s(S)$ is finite for some s, it vanishes for all s' < s, and conversely, if $\mathcal{H}^s(S) > 0$, then $\mathcal{H}^{s'}(S) = \infty$ for all s' > s. Therefore, there exists precisely one real number s where $\mathcal{H}^s(S)$ jumps from 0 to ∞ (by possibly attaining any value of $[0, \infty]$ there). This motivates the following definition of Hausdorff dimension:

Definition 1.2. The Hausdorff dimension $\dim_{\mathcal{H}}(S)$ of $S \subseteq E$ is defined as

$$\dim_{\mathcal{H}}(S) := \inf\{s \ge 0 : \mathcal{H}^s(S) > 0\}.$$

Due to the above discussion, we have the following equalities:

$$\dim_{\mathcal{H}}(S) = \inf\{s \ge 0 : \mathcal{H}^{s}(S) > 0\} = \inf\{s \ge 0 : \mathcal{H}^{s}(S) = \infty\}$$
$$= \sup\{s \ge 0 : \mathcal{H}^{s}(S) = 0\} = \sup\{s \ge 0 : \mathcal{H}^{s}(S) < \infty\},$$

providing some alternative characterisations of the Hausdorff dimension.

We further collect some important facts. To this end, let S, S' and $S_1, S_2, ...$ be subsets of E as before. Then, the following properties hold (cf. [Fal07, p.32f] for a discussion in the Euclidean setting; however all arguments adapt to our more general situation without complication):

Monotonicity. If $S \subseteq S'$ then $\dim_{\mathcal{H}}(S) \leq \dim_{\mathcal{H}}(S')$.

Countable Stability. For a sequence $(S_n)_{n\geq 1}$, we have the equality

$$\dim_{\mathcal{H}} \left(\bigcup_{n \ge 1} S_n \right) = \sup_{n \ge 1} \dim_{\mathcal{H}} (S_n).$$

Countable Sets. If $|S| \leq \aleph_0$ then $\dim_{\mathcal{H}}(S) = 0$.

Hölder continuous maps. If (E', d') is another metric space and $f: E \to E'$ is α Hölder continuous for some $\alpha \in (0, 1]$ then $\dim_{\mathcal{H}}(f(S)) \leq \alpha^{-1} \dim_{\mathcal{H}}(S)$. In particular, the Hausdorff dimension is invariant under a bi-Lipschitz transformation (i.e. an invertible map f with Hölder exponent $\alpha = 1$ for both f and f^{-1}).

Euclidean Case. If (E, d) happens to be an Euclidean space (or more generally a continuously differentiable manifold) of dimension n and S is an open subset then $\dim_{\mathcal{H}}(S) = n$.

1.2 Weyl asymptotics and spectral dimension

1.3 Diffusion processes and walk dimension

1.3.1 From Dirichlet forms to Markov processes

We start with the following definition (cf. [MR12, Def. IV.1.13]):

Definition 1.3. Given a filtered probability space $(\Omega, \mathscr{A}, \mathscr{F} = (\mathscr{F}_t)_{t\geq 0}, \mathbf{P})$ satisfying the usual conditions, an \mathscr{F} -adapted time-homogenous Markov process $X = (X_t)_{t\geq 0}$ with state space E_{Δ} is called a right process if it satisfies the strong Markov property for all \mathscr{F} -stopping times and all its trajectories are right continuous.
